Map review

Run QA

Trust your spatial data before

A public WebGIS demo for GeoQA. Atlas turns deterministic validation reports into visual review workflows for GIS, GeoAI, ML, publishing, and delivery teams.

Python engine

GeoQA remains the deterministic source of validation truth.

Atlas layer

Atlas is the map-first review and portfolio demo layer.

Map-first issue review

Review spatial findings on a readable map, inspect grouped issue cards, and move from problem to action without exposing private delivery data.

Issue drawer

Grouped findings stay readable and selected examples focus the map.

Report JSON

The same GeoQA report structure stays available for download and review.

GeoQA

Validation logic stays in Python. Atlas visualizes results without duplicating validators.

Run QA on selected local layers

The public demo previews the workflow with browser-readable data and sampled validation so users understand what GeoQA will check.

Layer select

Users choose the intended layer from multi-layer archives before review.

Python

Backend-connected validation calls the GeoQA Python engine.

JSON

Reports can be downloaded for review, automation, and delivery records.

What Atlas is for

A polished public-facing demo that helps people understand GeoQA in under five minutes.

For portfolio review

Show the product idea, interface quality, and map-first QA workflow without exposing private project data.

For GIS teams

Explain why geometry, CRS, topology, metadata, and delivery checks matter before analysis.

For delivery workflows

Turn QA into a reportable review step before publishing, ML preparation, or handoff.
